Parallelism Check between Measuring Faces by Means of Interference Fringe Produced by an Optical Parallel

The parallelism between the measuring faces can be determined as follows; place the optical parallel to the anvil and observe the number of interference fringes produced on the spindle side under the measuring force of the micrometers.

The parallelism is about $1\mu m$ (0.32 $\mu m \times 3 = 0.96\mu m$). Fringe on the anvil side must not be more than one.
